Is that GFX card 2nd hand? If so, I'm afraid that it may be broken... bsod can be caused by many things but usually indicates:
* driver problem
* hardware problem

Or it could simply be overheating, do you have case fans blowing over the card to shift hot air away from it, and have you verified the fan on the card itself (assuming it has one) is working correctly?

Most likely cause other than overheating is, as Gozy said, driver issues or hardware failure.
