No I dont mean right click properties then check the hidden box I mean is there any other way to hide files and folders without using that check hidden in properties way? I tryed google but could not find much on how or what program to us, Iv seen lot of law & order and some episodes people hides pictures and parts of files into other files so they cant be found and etc etc I want to be able to hide files so that it will be hard for others to find (dont ask why) anyone can help me?

[View Forum Message](#) <> [Reply to Message](#)

Well, I'm not too educated on what you're saying, but if you saw it on Law & Order there's a good chance it might not be possible. TV and movies tend to greatly exaggerate the capabilities of computers.

You can hide an entire operating system! I did this on my previous laptop because I travelled to the States every so often.

Yes, it's possible. You can hide files inside a picture just like a .rar/.zip archive. I forget how to do it though.

Depending on why your trying to do it, and who your trying to hide it from, you could simply create a partition to store 'hidden' things on, and then disable it from showing up in Windows Explorer using the NoDrives registry key. It's fairly well hidden from the casual observer, but it's not going to stop someone who knows what they are doing from getting to it (since you just manually type the drive letter into the address bar to get to it). Again, depends on the scenario and whom it is you want to hide it from.

<http://www.microsoft.com/technet/prodtechnol/windows2000serv/reskit/regentry/58871.msp?mfr=true>

As for hiding things inside other files, its pretty easy to do, although if you want to make sure said file still works as it normally would (and hence does not stick out as being unusual) you have to pick a file format where you can deliberately leave gaps in the file structure to hide things in. Incidentally, you can do this with the MIX file format used by Renegade for .mix, .dat and .pkg files fairly easily. Just don't be surprised if you hide a 700mb iso image inside a .jpg file and someone notices it

Another option would be to encrypt it then it won't really matter if it is hidden or not it will just show as "corrupted" when someone tries to open it, I recommend Glary Utilities this utility does tons of

other useful things too so check it out

1. You can pack a .rar/.zip/.7z archive into an image file (.jpg/.png/.gif/etc)
 2. LOL a 700+ mb .jpg better be an uber quality image!

I noticed some files that where hidden, really hidden, system files of course. It are some .sys files that won't show up, my anti virus says something about when I start a scan. Well, I think it is because I have a duelboot, anyway it are hiberfil.sys and pagefile.sys. Those won't show up in explorer.

Subject: Re: Hidden Files/Folder

[View Forum Message](#) <> [Reply to Message](#)

Untick 'Hide protected operating system files' to show those, it's a different option to 'Show hidden files'. It's called something like that anyway.

Also, hiberfil.sys is the hibernation storage file, which only exists if you have hibernation enabled in the power options and it's total size will always be equal to the total amount of RAM you have. pagefile.sys is, as the name suggests, the system pagefile.

It might be way easier if you just buy a cheap USB key to store all the files you don't want people to find. That way, you can physically hide it, and not have to worry about people poking around on your computer.

Not when the info and files are in the large side as in HDD size and cant easily carry around
Pocket-sized external harddrives

I also have a hard time believing you've got a file over 5 GB (Give or take a GB for perhaps an .iso or similar)

Yeah, yeah, we all know it's porn, and no one cares.

Using external storage would be the best option if you have that much stuff. Either that, or doing the secret 'OS' thing.

Truth be told, porn should always be stored in a separate location, off of the main computer.

I don't understand why you can't use the method I posted. You can even password protect the .zip file before copying the binary data to the new .jpg.

It doesn't have to be zip files and jpegs either, you can copy any files into one...

I have done yours and its good but im also looking for other ways thats good but passwords can be cracked I want some a little safer

(waits for people to flame and ask why)

You could try TrueCrypt from <http://www.truecrypt.org/>
It allows you to encrypt and hide stuff.

Why don't you just edit the NTFS permissions of the folders in question and delete the permission entries for the Everyone group and any other users, leaving just your personal account with access? Then, assuming you don't give anyone your password, leave the machine logged in or give out admin rights to everyone, the folder is fairly secure. Again, it probably wouldn't keep out a determined hacker who knows what they are doing, but it really depends who it is your trying to hide it from.
