[View Forum Message](#) <> [Reply to Message](#)

I saw how Scrin and D6 did there huds, and it got me thinking on the possibilities of drawing things on Renegade's screen.

Since the only way to keep source private while still releasing it is with a plugin...

Is there a way to draw parts of the hud via a plugin?

Just like you would with "void __declspec(dllexport) UpdateHUD2()" from the Shaders.dll?

[View Forum Message](#) <> [Reply to Message](#)

You couldn't keep the source private if you released a plug-in that was based on the scripts.dll shader's plug-in. It's still covered under the license agreement.

But yeah, you can draw thing on the screen with a shaders plug-in.

Ok well I guess I will just have to release it anyways...

It's just too awesome to keep to my self

The 'Shader Plugin Example' was hardly an example...

It was more like a Blank Plugin.

Does anyone know where I could find a better plugin example.

Also...

I'm a total nub and I don't know why the Output is saying this:

user32.lib is not linked in.

Ok that fixes that problem but why is it saying:
1>.\shaders.cpp(37) : fatal error C1189: #error :
The Renegade shaders.dll requires the DirectX August 2006 SDK installed in order to produce a proper executable.
If you wish to use a different version of the SDK, modify the delay load dll in linker settings to point to the newer d3dx.dll

I have

already set before it shows that error.

I have the same problem as Halo2pac. Is there someone who knows what do do to solve it??
Thx

It's saying that because you don't have the August 2006 SDK. If you don't, you need to modify the Delay-Load DLL to the proper dll file for the version of the SDK you have installed.

I know i have to do that but isnt the d3d9_30.dll already right?
It was added when installing the March 2009 SDK

So what do you think would it be for March 2009 if this isnt the one?

PS. The only difference between his screenshot and mine if i where to post one is i don't have user32.lib in the Additional Dependencies. Although this is surely not the problem xD

March 2009 definately is not d3dx9_30.dll. I just don't feel like looking it up; the only confirmed DirectX SDK to build shaders.dll is the August 2006 one. Install that.

March 2009 definately is not d3dx9_30.dll. I just don't feel like looking it up; the only confirmed DirectX SDK to build shaders.dll is the August 2006 one. Install that.

Ah you where indeed right. It was the file from the August 2006 SDK :S
I only cant find the more recent one. ATM im guessing on d3dx9_41.dll

EDIT: nope its not working but supposed to be this one i believe :S

EDIT2: I found this in shaders.cpp:

```
#if D3DX_SDK_VERSION != 30
```

```
#error The Renegade shaders.dll requires the DirectX August 2006 SDK installed in order to produce a proper executable. If you wish to use a different version of the SDK, modify the delay load dll in linker settings to point to the newer d3dx.dll
```

```
#endif
```

AFAIK this means even if i do change the Delay Load to the newest (confirmed that is d3dx9_41.dll) it will still give this error. Seems it doesnt check if it is newer/older yes or no but only if it is August 2006 version.

EDIT3: When i change `#if D3DX_SDK_VERSION != 30` to `#if D3DX_SDK_VERSION <= 30` it does seem to compile as it should. This way you should be able to use all version after August 2006.

Um is that a good idea?

and if so .. why not just remove the line instead of adding "`<=`"?

Um is that a good idea?

and if so .. why not just remove the line instead of adding "<="?

Actually it comes down to the same point as having to change the `_MSC_VER_ == 1400` to `_MSC_VER_ <= 1400` in `engine_common.cpp` (or something) to compile scripts on VC2008.

And i think you could delete the line BUT only if you also delete the 2 following lines otherwise it would ALWAYS give the error you have to change the Delay Load DLL.

I just changed it to `#if D3DX_SDK_VERSION <= 30` so i cant use any older SDK than August 2006. If you would use older it would maybe not work because it is to old. This way i eliminate the possibility of using older SDK's than August 2006.

The *reason* for that `#if` being exactly the way it was is so that the warning always triggers if you don't have the SDK matching that version number installed. If the DLL file says 41, the `D3DX_SDK_VERSION` is 41 and the line should be changed to read `#if D3DX_SDK_VERSION != 41`

I did use that first but as i typed earlier it works also in the way i use it now so it doesnt really matter because it works now too.

*Jumped into my mind:

And wouldnt that it the same for case for the change of `_MSC_VER_ == 1400` to `_MSC_VER_ <= 1400` which has to be changed to use a newer VC++ version than 2005.

What i did is actually the same but than for using a newer SDK instead of using a newer Compiler.

EDIT: What version does TT use for scripts 4.0?

And wouldnt that it the same for case for the change of `_MSC_VER_ == 1400` to `_MSC_VER_ <= 1400` which has to be changed to use a newer VC++ version than 2005.

What i did is actually the same but than for using a newer SDK instead of using a newer Compiler.

EDIT: What version does TT use for scripts 4.0?

It's not the same case as for the change of the `_MSC_VER_` because the DXSDK error was put in there to remind people to look at the project settings and match the SDK version up, whereas the `_MSC_VER_` code was put in there to fix issues with the way `scripts.dll` did things when Visual Studio 2005 SP1 *or newer* was used to compile it.

scripts 4.0 is currently using the November 2007 DirectX SDK

I did use that first but as i typed earlier it works also in the way i use it now so it doesnt really matter because it works now too.

*Jumped into my mind:

Ah i get it.

Thx
