Dunno if any of you guys have experience with cell phones, but I thought I'd post this here anyways, never know...

Anyway,

I have a Nokia 6085 cell, and I have placed several .jar apps on the phone. Most of them work fine, but some cannot do their proper function because the phone restricts its access capabilities. For instance, I can't use a .jar music player because the phone will not allow the app to access either my phone memory or my micro-sd memory. If I highlight the app and go to options>application access, I see where it is set to "not allowed", yet I cannot change it to "allowed" because it's greyed out and tells me "not available for this app." This happens to every single .jar I put on it.

Does anyone know how to make the phone allow apps to have these permissions?

-Altzan

you'd have to have your phone unlocked. You can do it yourself or pay some stores to do it

Hmm, I thought that had strictly to do with what carrier you could use the phone with - I ought to be able to edit app permissions within AT-T.

Unless AT-T is the one preventing it, kinda like Verizon locking up a lot of their phones to prevent modding.
