I tried to make headlights using the dazzle option but I can't figure out how it works. Every thing whit the dazzle option enabled doesn't shows up. I can't find anything on how to do it, the closest I came to is this:
http://www.renegadeforums.com/index.php?t=msg&goto=319601&rid=20921

I can select different dazzles from dazzle.ini but they don't make a difference.
The topic I found does create the same effect, except it doesn't scale when you get further from the light. It also doesn't gives the halo effect.

For some reason I can't make it work in 3ds max but I can get it to work in renx.

I'm sure someone else knows why.

Yes the Max tools don't export the dazzle from what I can tell. Anytime I use them, they are created in RenX as it properly displays them ingame. Another thing is I cannot view them in the

viewer, only in the editor.. I do believe I used to be able to view dazzles in the w3d viewer but now it doesn't display them
