So a couple of months ago before I did some changes to my computer, I was able to level edit and grab scripts from my 4.0 and use it on maps. For some reason, my level edit doesn't do that anymore. When I pull up a list of scripts available, they all look like default renegade scripts and none of the 4.0 scripts are listed.

I know it's a registry issue but I don't know where else to look because I checked common registries and fixed all of them already but still no luck unless I'm missing something else.

Any idea?

Fixed the problem. There was one path where it was reading my default FDS folder I had installed on my computer.

I then got the ttle.dll not found issues and just copied all the binaries to the level edit folder. I'm good to go!
