OK I have a

Pentium 3 800 Mhz
384 MB RAM
40 GB Hard Drive
Geforce 4 Ti 4600/Agp 8x
and my question is, why do I have slow down when I put the graphics on highest on renegade...
its just a massive slow down...
is it my graphics card or my CPU or Motherboard and don't forget that I got my computer about 3
years ago...

maybe updating your CPU..

??
i dunno sum people have GF2 on low speed computers with shit FPS i got my GF2 on a 1.6Ghz
and i get sweet fPS

I have a simalar spec to you, Ren crashed on loading the 2nd single player level when i had
700mhz p3 and 319mb of ram i upgraded to 1 gig P3 and 512 mb of ram and now fps goes as low
as 5 when all the team has vechiles and it's a war zone

You have enough RAM, a good (great) video card, but your processor needs upgrading. I'm also guessing that with the speed of your processor, your board doesn't support AGP 8x, so it's probably just using 4x which is not the full potential of your graphics card.

does it make a big difference if i have to use a pci graphics card because of a stupid cheap motherboard? My shitty motherboard dosent have an agp! I know it has to make a difference, but can anyone tell me if it might be worth upgrading my motherboard?

I bet your running an 8x AGP graphics card in a 4x AGP slot. As 8x AGP technology is new most motherboards that support it would be for the latest processors (AMD Athlon, Pentium 4). The fact that you have a Pentium 3 800 makes me think that your motherboard wouldn't be 8x APG supported. This could be a possible cause for your poor performance.

EDIT: Only read Crimsons post after i posted this.

yeah thats what i thought it was too, but anyways thx alot to u guys for not leaving me here with this problem, cause i heard that Geforce 4 ti4600 is something close to radeon 9700 pro, so thats why i bought it....

Its good to have all of yall out there

All respects

 Peace out

There is a 4x AGP version of the GeForce 4 Ti 4600. In performance tests the 8x AGP didn't exceed the 4x by much at all due to the lack of the hardawre to take full advantage of an 8x AGP. I'm sure your local retailer or etailer will give you a refund if not a replacemnt for a different version. Otherwise you should upgrade your Motyherboard, CPU and RAM and use the card that you have.

It should work fine. I ran Renegade on full graphics with a
PIII 600Mhz
384mb RAM
20GB Hard Drive
GeForce 2 MMX 440 64MB/AGP 2x
