I was in the middle of a battle trying to destroy 3 flames tanks that were coving a nuke beacon and i hit something that i forget what it was. All i remember was the command line thing came up so I deleted all the w's and d's that were in there. When i hit enter and the input line was blank but the font changed to be really faint and it's impossible to read anything. Does anyone know what I might have did and/or what I can do to fix it?

You simple hit the "`" key, the one before the number one by mistake somehow. All of those W's and D's appeared when you tried to move around, there the default movement keys. Delething the whole line and pressing enter should normally do nothing. Unless you typed some strange command it should be normal, the text appears in the top left to say "invalid command, press X for a list of commands ..." Try loading the game again and see if your problem is still there.

Well it's happening all the time and won't go away. Do you have any other suggestions?

You have altered the Screen UV Bias (I think).

Press

F8 then S then space and 1, (and then enter). That should return the blurry text to normal.
