Just bought a 9700pro a few weeks ago, and I just notice that under performance, the details keep resetting itself. I traid to run it at it's highest settings but it keeps resetting. It does this when I try to enable Anisotropic. I use the omega 3.4 driver with rage3d and it's at max settings on quality. I run everything at max and force AA and AF at their max settings. Yes I did the confige before I tried playing the game. I also tried doing this during the game and it still resets itself, truform doesn't work either. Anyone knows what I did wrong?

Chack your bios for AGP settings. Make sure you have 8x AGP enabled on the device bacause

---

as far as i know that card is an 8x AGP bus type. Other than that the card is getting unstable and resetting because you pushed it too far. This is normally a result of a dodgy cooling system. Put your hand on the heatsink of the GPU when in operation, if you can't hold your had on the heatsink then thats a sign of over heating. Normally if something is too hot to hold for more than a few seconds the temperature is around 55 - 65 degrees. Saying that it could be related to something else in your PC and or a fault on the card.
