Try using this. http://www.xp-smoker.com/

It helped me get some nice speed to my computer but beware.

ONLY USE RECCOMENDED SETTINGS.

You will get an assload of problems if you dont

if your looking for speed you probably shouldnt upgrade. If you know how to take care of your system you can make it run a lot faster. my comp isnt that fast, P3 600mhz, 128mb SDRAM, 16mb video card. yet my comp runs faster than my friends with comps that have almost double the specs. start by upgrading RAM, if you have winXp/2000 or a version of windows with Task manager take a look at how little your CPU is being used. and i suggest practicing or learning how to over clock an older/cheaper computer first
