Hi

All the frigin time all you hear is give me his ip, I wil teach him a lesson, or soemthing along those lines, I just have a simple question, what can you actually do once you have it? I thought that you cant dos anymore if the person has xp or the patch, you cant connect to them unless you have put a remote access trojen on there computer, half the people use dial up so there ip addresses change even half the people on dsl dont have static ip, and standard port flooding, isnt that filtered out by most firewalls ?

sorry if I am wrong, but I am jsut curious! i had great fun at school years ago when all the pcs were 95, nuking the bullys and enemys, and pissing off the teachers, but cant do it in xp, the only thing i can think off to pi$$ someone off is flood a webserver if running with requests, or just flooding and hope they dont have a firewall?

as i saiddont blame me if i am wrong, i am simply curious what you lot would actually do if someone did give you a ip to attack!

l8rs!
wil

you could packet them or if their comp isnt secure hack them.

but usually people saying stuff like that are idiots trying to look "1337"

lol,

that is what i thought, as i said, i am just intrested, I used to love doing little attacks and stuff on a lan at school, but across the internet with the level of security some people have on there pc, i just didnt think it is possible to willy nilly attack people if all you have is there ip, I understand port scanning and seeing if they have a program running to try and connect and hack them, but still if they have no program, it is imposible to physically break or damage there pc, just there current itnernet connection, but then when they restart it would be ok,
