Just to let you know, on my p3 1ghz I was getting a full 60 fps while also running br.net, wolspy, and restat

On this celeron 2.4ghz, I'm getting like 30-45 sfps... Appears taht these celerons suck horribly for running the renegade fds. Anyway I'm upgrading to the superserver 2.4 next month I'll let you know how it goes see if there is any change in my server fps... damn celerons and their low cache...

Ok, so on my old server machine, 566MHz, explain why i managed to get a full 60FPS while hosting? [Dedicated]

I think you'll find some other stuff was running on that machine

Regardless, Celerons are shit. Ew. 2.4 GHz would be about equal to a 1.4 GHz P4, maybe less.

How many people were you running? 2?

try 28 lets see what the sfps is :rolleyes:

Intel Celeron = cheap version of P4

just like the Duron is the cheap version of the Athalon, you get what you pay for, if the sfps is high, then don't worry about it.

i was able to host a 12 player server (usually full) on a PII 400 with 512m Ram, sfps was almost always around 50+
